

# B2B SaaS network architecture

Illustrative reference diagrams — network segmentation and administrative access, annotated for SOC 2 review

## 1. Network segmentation and data flow

Shows the path from external users through the CDN/WAF into the VPC, and the segmentation between the public subnet, application tier, and data tier. Highlights TLS in transit, security-group boundaries between tiers, and encryption at rest on the data tier.

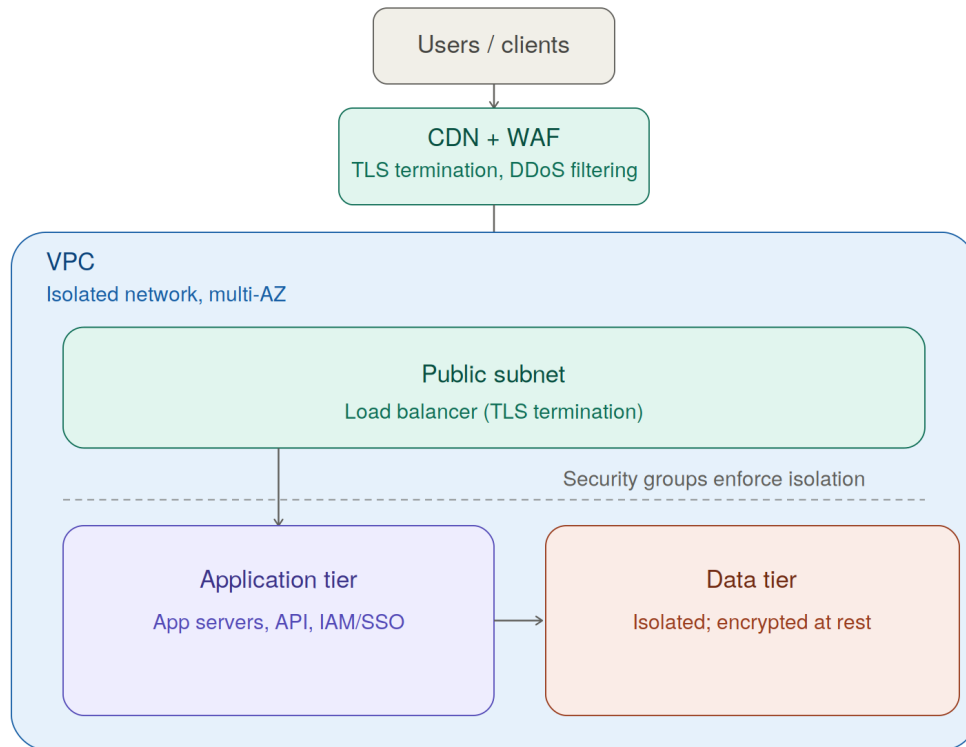

Figure 1: Network segmentation and data flow

## 2. Administrative access and logging

Shows the privileged-access path into production (MFA, VPN gateway, bastion host) and the logging path from production into a centralized SIEM for retention and alerting.

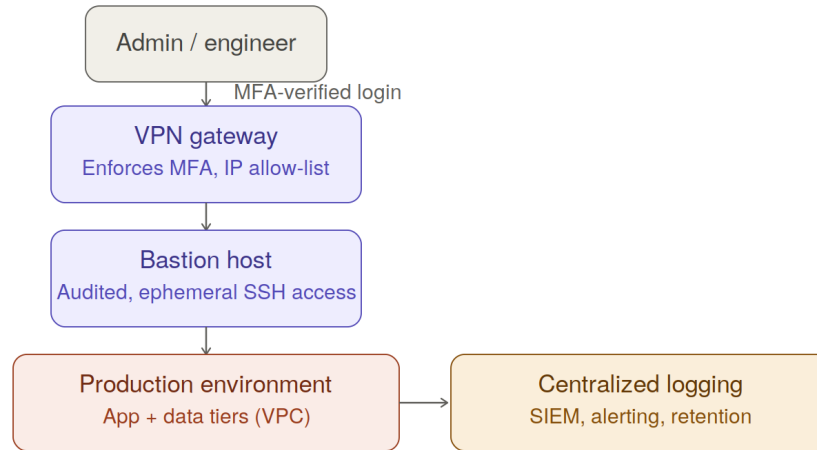

Figure 2: Administrative access and logging

Note: these are illustrative templates. For an actual SOC 2 engagement, the diagram must match the real configuration (security group rules, IAM policies, log retention settings) and that configuration is what auditors will test against.
